ABSTRACT

Placements can present a student with a variety of advantages and opportunities. An essential component of an educational institution where the majority of the labor is done by hand is training and placement management. In our SVCE [**SRI VENKATESHWARA COLLEGE OF ENGINEERING**] colleges, manual systems need a lot of labor and time. Our project's goal is to create an online portal that addresses this problem. The project's goal is to create a system for managing our college's placement office. The system is an application that, with the right login enabled, can be accessed and used efficiently across the entire enterprise. Additionally, it can be utilized as an application by our college's placement officers to handle student information regarding placement, cutting down on paperwork and manual labor and time consumption. Additionally, the system allows users to examine a student's academic and personal data. The desired list of candidates is obtained by the system on behalf of the companies seeking to hire individuals based on their eligibility requirements. PHP and MySQL are used on the backend of the placement management system, while HTML, CSS, and JavaScript are used on the front end.

Keywords: - front-end development, progressive web app, back end development, database management using MySQL and PHP.

Objectives:

The aim is to get students ready for college life.

To give pupils access to firm information and online aptitude.

To facilitate cooperation between industry institutes.

Chapter 1

1.1 INTRODUCTION

There is a high probability of error in manual training and placement because it involves human intervention and is carried out at our SVCE colleges. Finding and updating student data is the main issue. Placement officers are responsible for maintaining the student's file and profile. The placement officer's job is to gather the data from different companies that come in for hiring. They must organize student profiles based on different streams and notify them periodically in accordance with business needs. Placement officials input the student information; if any adjustments or modifications are needed, the student's profile must be updated manually. The more users there are the more challenging and time-consuming this procedure becomes. This takes a lot of time and effort. Like many other placement management websites, "Placement Management System" offers details on placement providers and placements, as well as maintains current student data. Students can use this platform to view and evaluate their options. The system will support many account kinds for various user categories, including administrators and students. Every student has a profile built with the portal login credentials. The system manages databases using MySQL and sorts student data according to the requirements set forth by the individual companies. A list of qualified applicants is then generated, and they have the option to select whether or not they would like to participate in that specific test or drive. The system will automatically register the interested candidates and produce a final data-set based on this. In this way, it lessens the workload that our college employees and instructors have to deal with issues brought on by mistakes made by people and time wasted on manual operations.

Chapter 2

2.1 LITERATURE SURVEY

The need for effective and practical management systems in educational institutions has stimulated considerable research and development in this area. This literature review highlights the key contributions of various studies, focusing on the design, implementation, and utility of online web-based chooser systems.

Major references and contributions

[1] Management system for training and placement (Mr K.P.Uvarajan, P.Raviraj, R.Sanjeekanth 2021) developed a network of online training and referral programs aimed at improving service delivery. The plan focuses on bridging the gap between students and potential employers by providing a platform for networking and easy data management. Key features include student registration, a resume, and matching company-specific standards. The study emphasizes reducing manual processes and errors, making the hiring process more reliable and efficient.

[2] Placement Management System (Twinkle Panchal, Prof.Aishwarya Sedamkar 2022) proposed a web-based student information system to overcome the challenges of dealing with large amounts of student data. Their system offers a range of student-centered activities including academic performance monitoring and including activities. The web-based nature of the system allows for easy access and real-time updates, ensuring that all stakeholders have up-to-date information. This study highlights the importance of data security and accuracy in the handling of student information.

[3] Placement Management System (Farheen Taqi Rizvi, Saurabh Sanjay Upadhyay 2021) developed an online training and intervention program focusing on comprehensive student achievement. It has features such as automated eligibility testing, information systems and feedback mechanisms. The study shows how such programs can significantly reduce the administrative burden of placement professionals and improve student preparation for job interviews.

[4] Placement Management System (Punitha Nicholi J, Lakshmi Priya B, Ilakkiya S, Kartheeswari M 2023) studied the implementation of online management systems, highlighting the challenges and solutions associated with digital transformation of spatial activities Their study identifies the critical success factors of such systems implementation in, including user friendliness, scalability and integration with existing academic content Santi research provides a comprehensive assessment of how online systems can provide system building there to simplify and improve overall efficiency.

[5] Placement Management System for Campus Recruitment (Ajeena Sunny, Aneena Felix, Praseetha V.M 2020) Laird examined the principles and practices of interactive web-based installation management using the OPUS platform. Their research focuses on creating user-friendly interfaces that allow students to communicate seamlessly with recruiters and potential employers. The interactive nature of the system facilitates real-time updates and immediate communication, which is critical for successful installation activities.

2.2 EXSISTING SYSTEM

The current system describes the characteristics of the previous operating model as well as its shortcomings. The current system does every task by hand. Placement officers keep student data on file. Any edits or changes that need to be made to a student's profile must be completed manually. This is laborious and time-consuming, requires more staff, uses a lot of paper, and takes up a lot of space. It also compromises data security. This strategy becomes quite difficult as the user base grows. A placement officer had to gather student information under the prior system in order to make placements. It requires a lot of time to approve those student details. If more information is needed, the internship coordinator and the students should ask for it directly. If a new business requests placements, Current college placement management systems aim to simplify the placement process, which facilitates students' job search and makes it easier for colleges to oversee the placement process. Typically, these systems consist of several modules, such as company, admin, and student modules. Institutions can plan placements, train students to meet industry demands, host placement drives, and let businesses hire students with the help of a placement management system. It allows students to establish profiles, apply for jobs, get shortlisted with higher visibility, take part in internship activities, and more. It also maintains student and placement cell information.

The following are some drawbacks of the current system:

- It takes a long time for a placement officer to gather student information and approve it.
- There is a lack of contact between the placement officer and the students, making it difficult to recommend fresh postings here.
- Students might not be aware of business specifics. Another issue is the inadequate communication.
- A concerned training and placement officer may not be at the desk, hence the candidate may not receive the necessary information.

2.3 PROPOSED SYSTEM

All of the aforementioned shortcomings are resolved by the designed system. Instead of being kept in handwritten records, all the information on graduates, employers, and administrators is kept in a standardized database. This feature facilitates the maintenance of a consistent, readily maintainable, and non-redundant database.

This technique aids in preventing graduates from registering themselves more than once.

→ The primary consumers consist of

- 1.Students
- 2.Supervisor

A student is an individual who is seeking employment inside the same organization, regardless of experience level. Once all the information has been entered, students will be able to see a page with all of the open positions. Students can now apply to one or more positions, with the Administrator informing them later on the specifics of the interview.

Learner Module:

Login and registration for students Use the filters to view job ads (by company, location, and job type) Apply for positions by uploading your resume and cover letter. View the status of your application and get admin feedback. Examine job descriptions and company profiles. Get suggestions for jobs based on your choices and profile.

Administrator Module:

Admin signup and access Post job opportunities together with a job description and company profile. Examine submissions that include resumes and student profiles. Update the application's status with feedback (accept/reject). View the resumes and biographies of the students. Organize job listings and company profiles Provide placement data and student performance reports.

2.4 TECHNOLOGIES USED

System for managing SVCE College Placement

A web-based tool called the College Placement Management System assists colleges and universities in managing their placement procedures. On the front end, HTML, CSS, and JavaScript are utilized in the system's construction, while PHP and MySQL are employed on its back end.

Technology at the back end:

PHP: A programming language used for dynamic web page creation, server-side scripting, and database interaction.

The relational database management system MySQL is used to store and manage student, job advertisement, and placement record data.

Front-end engineering:

Web page content is created and organized using HTML.

CSS: This is used to style and arrange webpages.

XAAMP Server: Apache HTTP Server, MySQL, PHP, and Perl comprise this free and open-source software stack. It offers a practical method for configuring a local web server for testing and development.

Database: MySQL: Data may be stored and retrieved using this relational database management system. The Placement Management System's database schema would comprise tables for administrators, job advertisements, applications, and students.

Safety:

SQL Injection Protection: By using parameterized queries and prepared statements, PHP guards against SQL injection attacks. Password Hashing: To prevent unwanted access, passwords are hashed using a safe technique like bcrypt. Session Management: To control user sessions and stop illegal access, PHP has a built-in session management system.

Modules of the System:

The student module enables users to sign up, browse job listings, and submit applications.

Placement officers can check student applications, update job advertisements, and keep track of placement records with the help of the admin module.

Features of the System:**Student Module:**

Registration: By entering their academic and personal information, students can register on the system.

Job Search: Depending on their choices, students can look for and examine job postings.

Job Application: Students have the ability to check the status and inbox messages for job applications.

Placement Officer (Admin Module):

Placement officers have the ability to post job vacancies with specific employment needs and specifications.

Placement officials have access to see and handle student applications, as well as schedule interviews and keep track of placement records.

Placement Tracking: By keeping track of placement records, placement officials are able to produce reports on placement data. Placement officials have the ability to examine and oversee student profiles, keeping tabs on their placement records.

Schema for Databases:

The tables listed below make up the database schema:

students: Keeps track of personal and academic information about students.

job postings: Holds job advertisements, along with the position's specifications.

applications: Keeps track of resumes and cover letters sent by students for jobs.

placement records: Holds information about employment offers and acceptances, among other things.

Chapter 3

3.1 IMPLEMENTATION

The project is broken up into four modules: Update corporate data; Dashboard module; Admin; and Student.

Module for students:

This module includes a page for current users to log in and a registration process for new users. The user's decision regarding their username and password is entirely their own.

This module has the following features:

- Students can upload their information at any moment.
- Viewing company requirements is possible.
- Based on certain criteria, they can shortlist the business.

Administrator module: Admin is forced to use the system via this module. In this module, the administrator will be the Training and Placement Officer. Updates corporate data; adds a news feed; authenticates enrolled students; and adds company details.

Dashboard Module: The students can view the impending interview process for their organization in this basic module. The student information is arranged by batch. The user has access to the prior batch's placement details.

Update company data: The administrator is in charge of this module, which is faculty. They can amend additional information, such as the future name of the business. In addition, the company has integrated feedback so that users can leave their own reviews on the web.

Student Module: Students can log in, read job posts, and apply for positions using the student module. The student login page, `index.html`: This is where students can access the system and log in. A straightforward form with email and password fields is shown on the page. Upon submission of the form by the student, `login.php` receives the data for processing. The student login script, `login.php`: Using a database connection, this script verifies that the student's email address and password correspond to the entries in the students table. The script sets the session variables student id and logged in to true and reroutes the student to `student_dashboard.php` if the credentials match. The script shows an error message if the credentials are not the same. The student dashboard, located at `student_dashboard.php`

Administrator Module: Admin may post job vacancies, handle applications, and log in using the admin module. The admin login page, `admin_index.html`: This is where administrators can access the system and log in. The page has a straightforward form with spaces for a username and password. The data is submitted to `admin_login.php` (Admin login script) for processing when the administrator submits the form. Using a database connection, this script verifies that the administrator's login credentials and password correspond to the entries in the admin table. The script sets the session variables admin id and logged in to true and reroutes the administrator to `admin_dashboard.php` if the credentials match. The script shows an error message if the credentials are not the same. **PHP admin dashboard (Dashboard for administrators):** A list of job openings and applications is shown on this page. To obtain a list of job listings, the page queries the `job_postings` table. The title, description, and posted by details of each job ad are shown. To examine applications for a position, the administrator can click the "View Applications" link, which directs them to `view_applications.php`. **post_job.php (Post job opening):** The job title, description, and posted by information are added to a new record that is inserted into the `job_postings` table by this script. The job posting has been created, and the administrator receives a success message from the script. The application view, `view_applications.php`: A list of applications for a certain job ad is displayed on this page. To obtain a list of applications for the chosen job posting, the website queries the `applications` table. The name, email address, and application status of each student are shown with the application. Using the provided links, the administrator can change the application status to "accepted" or "rejected". Using student and admin modules, this implementation offers a fundamental framework for handling college placement. While administrators can log in, post job vacancies, and handle applications, students can log in, see job ads, and apply for positions through the student module.

3.2 SOURCE CODE

student login:

```
<?php
    session_start();
    if($_SESSION["username"]){
    }
    else {
        header("location: index.php");
    }
?>

Chapter 4

4.1 OUTCOMES AND RESULT

By supplying student details through an online gateway, the online student management system alleviates the strain of the manual approach now in place. The program is easy to use; anyone can examine placement details and easily change their personal and educational statuses. This system is built using MySQL, XAMP, CSS, HTML, and This application's primary features include batch-wise placement details, corporate details viewing, and the registration process. Based on data entered by teachers and students, the website is dynamically updated. Faculty can also access student details using CURD operation, which includes secure mail authentication. The new online placement infrastructure management system is the main emphasis of this application.

Chapter 5

5.1 CONCLUSION

A vital component of an educational institution when the majority of the work is done manually is placement management. In colleges, manual systems need a lot of labor and time. Our project's goal is to create an online portal that addresses this problem. The project's goal is to develop an application for the college's placement office. The system is an application that, with the right login enabled, can be accessed and used efficiently across the entire enterprise. It can also be used as an application by the college's placement officers to handle student placement data, which minimizes manual labor and paper consumption. Additionally, your system assists the college in overcoming the challenge of maintaining records for hundreds of students and looking

5.2 FUTURE ENHANCEMENTS

To enhance the college placement management system at SVCE, we could introduce a more comprehensive company model. This would enable companies to register on the platform, post job listings, and view student profiles, making the system more interactive and inclusive. Companies could also schedule interviews and communicate directly with students through the platform, streamlining the recruitment process. Implementing a real-time notification system would be particularly beneficial, ensuring that both students and placement officers receive immediate alerts for any new messages or updates from the placement cell.

Another valuable enhancement would be the addition of an analytics and reporting module. This feature could track essential placement metrics, such as the number of students placed, the companies that have visited the campus, and the average salary offers. It could also produce detailed reports for placement officers and the college administration, offering insights into the success of the placement process and supporting informed decision-making.

To further improve the student experience, a progress-tracking feature could be incorporated. This would allow students to update their application statuses, log interview outcomes, and manage job offers in one centralized location. This feature would not only help students keep track of their placement journey but also provide placement officers with real-time data on student progress. Additionally, integrating notifications for key updates, such as new job postings or interview schedules, would ensure that students and placement officers are always well-informed and an
